

AUSTRALIAN PRODUCT INFORMATION

BREO ELLIPTA (fluticasone furoate/vilanterol trifenate) powder for inhalation

1 NAME OF THE MEDICINE

Fluticasone furoate/vilanterol trifenate

2 QUALITATIVE AND QUANTITATIVE COMPOSITION

BREO ELLIPTA 100/25: Each foil strip contains regularly distributed blisters with one strip containing a powder formulation of 100 micrograms of fluticasone furoate and the other strip containing 25 micrograms of vilanterol (as trifenate). Each delivered dose (the dose leaving the mouthpiece) contains of 92 micrograms of fluticasone furoate and 22 micrograms of vilanterol (as trifenate).

BREO ELLIPTA 200/25: Each foil strip contains regularly distributed blisters with one strip containing a powder formulation of 200 micrograms of fluticasone furoate and the other strip containing 25 micrograms of vilanterol (as trifenate). Each delivered dose (the dose leaving the mouthpiece) contains of 184 micrograms of fluticasone furoate and 22 micrograms of vilanterol (as trifenate).

Excipients with known effect

BREO ELLIPTA contains the excipient lactose monohydrate (which contains milk protein).

For the full list of excipients, see Section 6.1 LIST OF EXCIPIENTS.

3 PHARMACEUTICAL FORM

Powder for inhalation.

White powder in a light grey inhaler (Ellipta) with a pale blue mouthpiece cover and a dose counter.

4 CLINICAL PARTICULARS

4.1 THERAPEUTIC INDICATIONS

COPD

BREO ELLIPTA is indicated for symptomatic treatment of patients with COPD with a FEV₁ <70% predicted normal (post-bronchodilator) in patients with an exacerbation history despite regular bronchodilator therapy.

BREO ELLIPTA is not indicated for the initiation of bronchodilator therapy in COPD.

Asthma

BREO ELLIPTA is indicated in the regular treatment of moderate to severe asthma in patients who require a medium to high dose inhaled corticosteroid combined with a long-acting beta₂-agonist.

Vilanterol, an active ingredient in BREO ELLIPTA, is a long-acting beta₂-agonist (LABA). A class effect of all LABAs can be an increased risk of asthma death (see Section 4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE).

4.2 DOSE AND METHOD OF ADMINISTRATION

Dose

Asthma

Patients should be made aware that BREO ELLIPTA must be used regularly, even when asymptomatic.

If symptoms arise in the period between doses, an inhaled, short-acting beta₂-agonist should be taken for immediate relief.

Patients should be regularly reassessed by a healthcare professional so that the strength of BREO ELLIPTA they are receiving remains optimal and is only changed on medical advice. To minimise adverse reactions, inhaled corticosteroids should be used at the lowest dose that maintains symptom control.

Adults and adolescents aged 12 years and over

The recommended dose of BREO ELLIPTA is:

One inhalation of BREO ELLIPTA 100/25 micrograms once daily

or

One inhalation of BREO ELLIPTA 200/25 micrograms once daily

A starting dose of BREO ELLIPTA 100/25 micrograms should be considered for patients who require a mid-dose of inhaled corticosteroid in combination with a long acting beta₂-agonist.

BREO ELLIPTA 200/25 micrograms should be considered for patients who require a higher dose of inhaled corticosteroid in combination with a long acting beta₂-agonist.

If patients are inadequately controlled on BREO ELLIPTA 100/25 micrograms, consider increasing the dose to 200/25 micrograms, which may provide additional improvement in asthma control.

Table 1. Recommended Doses of BREO ELLIPTA for asthma patients on existing therapies

Existing therapy	Recommended Dose
<p>For patients uncontrolled on FP 100 micrograms to FP 250 micrograms twice daily or equivalent (200-400 micrograms twice daily of budesonide)</p> <p>For patients uncontrolled on low doses of ICS/LABA combinations (FP/salmeterol 100/50 micrograms twice daily or Budesonide/eformoterol 200/6 micrograms one or two actuations twice daily)</p> <p>For patients controlled on mid doses of ICS/LABA (FP/salmeterol 250/50 micrograms twice daily or budesonide/eformoterol 200/6 micrograms two actuations twice daily)</p>	<p>BREO ELLIPTA 100/25 micrograms once daily</p>
<p>For patients uncontrolled on FP 500 micrograms twice daily or equivalent (600-800 micrograms twice daily of budesonide)</p> <p>For patients uncontrolled on mid doses of ICS/LABA combinations (FP/salmeterol 250/50 micrograms twice daily or budesonide/eformoterol 200/6 micrograms two actuations twice daily)</p> <p>For patients controlled on high dose ICS/LABA combinations (FP/salmeterol 500/50 micrograms twice daily or budesonide/eformoterol 400/12 micrograms two actuations twice daily)</p>	<p>BREO ELLIPTA 200/25 micrograms once daily</p>

Prescribers should be aware that 100 micrograms of fluticasone furoate is a medium dose of inhaled corticosteroid and 200 micrograms of fluticasone furoate is a high dose of inhaled corticosteroid. In patients with asthma, 100 micrograms of fluticasone furoate taken once daily produces similar effects to fluticasone propionate 250 micrograms taken twice daily and 200 micrograms of fluticasone furoate taken once daily produces similar effects to fluticasone propionate 500 micrograms taken twice daily.

To minimise adverse reactions, inhaled corticosteroids should be used at the lowest dose that maintains symptom control. Patients should be assessed at regular intervals. In patients whose asthma is well controlled and stable the BREO ELLIPTA dose may carefully be down-titrated to the lowest strength of BREO ELLIPTA.

The next step should consider the cessation of BREO ELLIPTA and transfer to an appropriate inhaled corticosteroid containing regimen. When deemed clinically appropriate the inhaled corticosteroid dose should be further adjusted to the lowest dose at which effective control of asthma is maintained.

Additional recommendations for adolescents aged 12 years and older

Down-titration to the lowest inhaled corticosteroid dose is especially important in adolescents who may be more susceptible to systemic corticosteroid effects (see Section 4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE). When down-titrating to another product, consideration should be given to maintaining a once-daily regimen to facilitate compliance.

Children aged less than 12 years

BREO ELLIPTA should not be used in children younger than 12 years of age.

COPD

Adults

The recommended dose of BREO ELLIPTA is:

One inhalation of BREO ELLIPTA 100/25 micrograms once daily.

BREO ELLIPTA 200/25 micrograms is not indicated for patients with COPD. There is a potential increased risk of pneumonia and corticosteroid-related adverse reactions with the 200/25 microgram dose (see Section 4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE and Section 4.8 ADVERSE EFFECTS (UNDESIRABLE EFFECTS)).

Asthma and COPD

Elderly

Due to limited data in patients with asthma aged 75 years and older, BREO ELLIPTA 200/25 is not recommended.

Renal impairment

No dose adjustment is required for patients with renal impairment (see Section 5.2 PHARMACOKINETIC PROPERTIES, Special Patient Populations).

Hepatic Impairment

A clinical pharmacology study in subjects with mild, moderate and severe hepatic impairment showed up to 3-fold increase in systemic exposure to fluticasone furoate (AUC) (see Section 5.2 PHARMACOKINETIC PROPERTIES, Special Patient Populations).

Caution should be exercised when dosing patients with hepatic impairment who may be more at risk of systemic adverse reactions associated with corticosteroids.

For patients with moderate or severe hepatic impairment the maximum dose is 100/25 micrograms (see Section 5.2 PHARMACOKINETIC PROPERTIES).

Method of administration

BREO ELLIPTA is for inhalation only.

BREO ELLIPTA should be administered once daily either morning or evening but at the same time every day.

After inhalation, the patient should rinse their mouth with water without swallowing.

4.3 CONTRAINDICATIONS

BREO ELLIPTA is contraindicated in patients with severe milk-protein allergy or who have demonstrated hypersensitivity to either fluticasone furoate, vilanterol or any of the excipients.

4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE

Precautions for use

Vilanterol, an active ingredient in BREO ELLIPTA, is a long-acting beta₂-agonist (LABA). Limited post-marketing data are available for vilanterol; however, post-marketing data for other LABAs show that LABAs can be associated with an increased risk of asthma death. This is considered a class effect of all LABAs.

Fluticasone furoate 100 micrograms is a medium dose of inhaled corticosteroid and fluticasone furoate 200 micrograms is a high dose of inhaled corticosteroid. Medium to high doses of inhaled corticosteroids may cause systemic effects. These include growth retardation in adolescents (see below under Section 4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE, Systemic corticosteroid effects).

BREO ELLIPTA should only be used for patients not adequately controlled on a long-term, asthma control medication, such as an inhaled corticosteroid. Patients should be assessed at regular intervals. The dose should be titrated to the lowest dose at which effective control of symptoms is maintained. In patients whose asthma is well controlled and stable with the lowest strength of BREO ELLIPTA, the next step should consider cessation of BREO ELLIPTA and transfer to maintenance therapy with an inhaled corticosteroid alone.

BREO ELLIPTA should not be used more often than recommended, at higher doses than recommended, or in conjunction with other medicines containing LABA, as an overdose may result. Clinically significant cardiovascular effects and fatalities have been reported in association with excessive use of inhaled sympathomimetic drugs. Patients using BREO ELLIPTA should not use another medicine containing a LABA (e.g., salmeterol, eformoterol, indacaterol) for any reason.

BREO ELLIPTA 200/25 micrograms is not recommended for patients with COPD (see Section 4.2 DOSE AND METHOD OF ADMINISTRATION).

Deterioration of disease

BREO ELLIPTA should not be used to treat acute asthma symptoms or an acute exacerbation in COPD, for which a short-acting bronchodilator is required. Increasing use of short-acting bronchodilators to relieve symptoms indicates deterioration of control and patients should be reviewed by a physician.

Patients with asthma or COPD should have a personal action plan designed in association with their general practitioner. Patients should not stop therapy with BREO ELLIPTA, in asthma or COPD, without physician supervision since symptoms may recur after discontinuation.

Serious and potentially life-threatening, asthma-related adverse events and exacerbations may occur during treatment with BREO ELLIPTA. Patients should be asked to continue treatment but to seek medical advice if asthma symptoms remain uncontrolled or worsen after initiation of fluticasone furoate/vilanterol.

Paradoxical bronchospasm

As with other inhalation therapy, paradoxical bronchospasm may occur with an immediate increase in wheezing after dosing. This should be treated immediately with a short-acting inhaled bronchodilator. BREO ELLIPTA should be discontinued immediately, the patient assessed and alternative therapy instituted if necessary.

Cardiovascular effects (see Section 4.8 ADVERSE EFFECTS (UNDESIRABLE EFFECTS))

Cardiovascular effects, such as cardiac arrhythmias e.g. supraventricular tachycardia and extrasystoles may be seen with sympathomimetic drugs, including fluticasone furoate/vilanterol. In addition, beta₂-agonists have been reported to produce electrocardiographic changes, such as flattening of the T wave, prolongation of the QTc interval, and ST segment depression, although the clinical significance of these findings is unknown. Therefore, BREO ELLIPTA should be used with caution in patients with severe cardiovascular disease.

Use in hepatic impairment

For patients with moderate to severe hepatic impairment, the 100/25 micrograms dose should be used and patients should be monitored for systemic corticosteroid-related adverse reactions (see Section 4.2 DOSE AND METHOD OF ADMINISTRATION and Section 5.2 PHARMACOKINETIC PROPERTIES).

Systemic corticosteroid effects

Systemic effects may occur with any inhaled corticosteroid, particularly at high doses prescribed for long periods. These effects are much less likely to occur than with oral corticosteroids. Possible systemic effects include Cushing's syndrome, Cushingoid features, adrenal suppression, decrease in bone mineral density, growth retardation in children and adolescents, and more rarely, a range of psychological or behavioural effects including psychomotor hyperactivity, sleep disorders, anxiety, depression or aggression (particularly in children).

Ocular effects may be reported with systemic and topical corticosteroid use. If a patient presents with a change in vision, the patient should be considered for referral to an ophthalmologist for evaluation of possible causes which may include cataract, glaucoma or rare diseases such as central serous chorioretinopathy (CSCR).

Inhaled corticosteroids should be used with caution in patients with active or quiescent tuberculosis infections of the respiratory tract; systemic fungal, bacterial, viral, or parasitic infections; or ocular herpes simplex.

Hyperglycaemia

There have been reports of increases in blood glucose levels with fluticasone furoate/vilanterol. This should be considered in patients with a history of, or with risk factors for, diabetes mellitus (see Section 4.8 ADVERSE EFFECTS (UNDESIRABLE EFFECTS)).

Pneumonia

An increase in pneumonia has been observed in patients with COPD receiving fluticasone furoate/vilanterol. There was also an increased incidence of pneumonias resulting in hospitalisation. In some incidences these pneumonia events were fatal (see Section 5.1 PHARMACODYNAMIC PROPERTIES, Clinical trials and Section 4.8 ADVERSE EFFECTS

(UNDESIRABLE EFFECTS)). Physicians should remain vigilant for the possible development of pneumonia in patients with COPD as the clinical features of such infections overlap with the symptoms of COPD exacerbations. Risk factors for pneumonia in patients with COPD receiving fluticasone furoate/vilanterol include current smokers, patients with a history of prior pneumonia, patients with a body mass index <25 kg/m² and patients with a (forced expiratory volume) FEV₁<50% predicted. These factors should be considered when BREO ELLIPTA is prescribed and treatment should be re-evaluated if pneumonia occurs.

BREO ELLIPTA 200/25 micrograms is not indicated for patients with COPD. There is a potential increased risk of pneumonia and systemic corticosteroid-related adverse reactions with fluticasone furoate/vilanterol 200/25 micrograms (see Section 4.8 ADVERSE EFFECTS (UNDESIRABLE EFFECTS)).

The incidence of pneumonia in patients with asthma taking fluticasone furoate/vilanterol 200/25 micrograms was numerically higher compared with those receiving fluticasone furoate/vilanterol 100/25 or placebo (see Section 4.8 ADVERSE EFFECTS (UNDESIRABLE EFFECTS)). No risk factors were identified.

Sensitivity to sympathomimetic amines

BREO ELLIPTA, like all medicines containing sympathomimetic amines, should be used with caution in patients with convulsive disorders or hyperthyroidism and in those who are unusually responsive to sympathomimetic amines.

Hypokalaemia and Hyperglycaemia

Beta-adrenergic agonist medicines may produce significant hypokalaemia in some patients, possibly through intracellular shunting, which has the potential to produce adverse cardiovascular effects. The decrease in serum potassium is usually transient, not requiring supplementation. Beta-agonist medications may produce transient hyperglycaemia in some patients. In clinical trials evaluating fluticasone furoate/vilanterol in subjects with asthma or COPD, there was no evidence of a treatment effect on serum glucose or potassium.

Use in the elderly

Due to limited data in patients with asthma aged 75 years and older, BREO ELLIPTA 200/25 is not recommended.

Paediatric use

BREO ELLIPTA should not be used in children (i.e. patients younger than 12 years of age).

Effects on laboratory tests

Interactions with laboratory tests have not been established.

4.5 INTERACTIONS WITH OTHER MEDICINES AND OTHER FORMS OF INTERACTIONS

Clinically significant drug interactions mediated by fluticasone furoate or vilanterol at clinical doses are considered unlikely due to the low plasma concentrations achieved after inhaled dosing.

Interaction with beta-blockers

Beta-adrenergic blockers may weaken or antagonise the effect of beta₂-adrenergic agonists. Concurrent use of both non-selective and selective beta-blockers should be avoided unless there are compelling reasons for their use.

Interaction with CYP3A4 inhibitors

Fluticasone furoate and vilanterol are both rapidly cleared by extensive first pass metabolism mediated by the liver enzyme CYP3A4.

Care is advised when co-administering with strong CYP 3A4 inhibitors (e.g. ketoconazole, ritonavir) as there will be increased systemic exposure to both fluticasone furoate and vilanterol, which could lead to an increase in the potential for adverse reactions (see Section 5.2 PHARMACOKINETIC PROPERTIES).

Interaction with P-glycoprotein inhibitors

Fluticasone furoate and vilanterol are both substrates of P-gp. A clinical pharmacology study in healthy subjects with co-administered vilanterol and the potent P-gp and moderate CYP3A4 inhibitor verapamil did not show any significant effect on the pharmacokinetics of vilanterol. Clinical pharmacology studies with a specific P-gp inhibitor and fluticasone furoate have not been conducted.

Interaction with sympathomimetic medicinal products

Concomitant administration of other sympathomimetic agents (alone or as part of combination therapy) may potentiate the undesirable effects of BREO ELLIPTA. BREO ELLIPTA should not be used in conjunction with other long-acting beta₂-adrenergic agonists or medicinal products containing long-acting beta₂-adrenergic agonists.

Interaction with monoamine oxidase inhibitors and tricyclic antidepressants

Vilanterol, like other beta₂-agonists, should be administered with extreme caution to patients being treated with monoamine oxidase inhibitors, tricyclic antidepressants, or drugs known to prolong the QTc interval because the effect of adrenergic agonists on the cardiovascular system may be potentiated by these agents. Drugs that are known to prolong the QTc interval have an increased risk of ventricular arrhythmias.

4.6 FERTILITY, PREGNANCY AND LACTATION

Effects on fertility

There are no fertility data in humans. Studies in rats showed no effect of vilanterol or fluticasone furoate on male or female fertility.

Use in pregnancy

(Pregnancy Category B3)

There are no adequate and well-controlled trials with fluticasone furoate/vilanterol in pregnant women. Corticosteroids and beta₂-agonists have been shown to be teratogenic in laboratory animals when administered systematically at relatively low dosage levels.

Maternal and fetal toxicity (likely due to the fluticasone furoate component) were observed in rat embryofetal development study with the fluticasone/vilanterol combination at fluticasone

furoate doses of 29.5 and 82 µg/kg/day, respectively (equivalent to 3 and 9 times, respectively, the clinical exposure based on AUC).

In rabbits, there was evidence of maternal toxicity and embryotoxicity following inhalation exposure to vilanterol triphenylacetate at 591 and 62.7 µg/kg/day, respectively (equivalent to 150 and 14 times the clinical exposure based on AUC). A non-dose related increase in malformations, including the rare open eyelid, was also observed. In a separate study with subcutaneous exposure, increased incidence of open eye and increase in skeletal variations (indicative of developmental delay) occurred at 300 µg/kg/day (equivalent to 1000 times the clinical exposure based on AUC) with a NOAEL of 30 µg/kg/day (equivalent to 84 times the clinical exposure based on AUC).

Administration of BREO ELLIPTA to pregnant women should only be considered if the expected benefit to the mother is greater than any possible risk to the foetus.

Use in lactation

There is limited information on the excretion of fluticasone furoate or vilanterol or their metabolites in human milk. However, other corticosteroids and beta₂-agonists are detected in human milk. A risk to breastfed newborns/infants cannot be excluded.

A decision must be made whether to discontinue breast-feeding or to discontinue BREO ELLIPTA therapy taking into account the benefit of breast-feeding for the child and the benefit of therapy for the woman.

4.7 EFFECTS ON ABILITY TO DRIVE AND USE MACHINES

There have been no studies to investigate the effect of fluticasone furoate/vilanterol on driving performance or the ability to operate machinery. A detrimental effect on such activities would not be anticipated from the pharmacology of fluticasone furoate or vilanterol.

4.8 ADVERSE EFFECTS (UNDESIRABLE EFFECTS)

Clinical trial data

The most frequent adverse events, based on studies including a comparator, are presented in Table 2 and Table 3 for asthma and COPD, respectively.

Table 2. Adverse Events With ≥3% Incidence With Fluticasone Furoate/Vilanterol in Asthma (Integrated Asthma Clinical Studies)

Adverse Event (Preferred Term)	Number (%) of Subjects						
	Placebo N=680	FF/VI 100/25 N=1467	FF/VI 200/25 N=455	FF 100 N=1544	FF 200 N=489	Placebo +ICS N=218	VI 25 +ICS N=216

¹ URTI = Upper respiratory tract infection

*Includes terms oral candidiasis, oropharyngeal candidiasis, candidiasis, and oropharyngitis fungal.

Data from large asthma and COPD clinical trials were used to determine the frequency of adverse reactions associated with fluticasone furoate/vilanterol. In the asthma clinical development program a total of 7,034 patients were included in an integrated assessment of adverse reactions. In the COPD clinical development program a total of 6,237 subjects were included in an integrated assessment of adverse reactions.

With the exception of pneumonia and fractures, the safety profile was similar in patients with asthma and COPD. During clinical studies, pneumonia and fractures were more frequently observed in patients with COPD.

These adverse reactions are listed by system organ class and frequency. The following convention has been used for the classification of adverse reactions:

Very common: $\geq 1/10$

Common: $\geq 1/100$ to $< 1/10$

Uncommon: $\geq 1/1000$ to $< 1/100$

Rare: $\geq 1/10000$ to $< 1/1000$

Very rare: $< 1/10000$

Table 4. Adverse Reactions with BREO ELLIPTA listed by MedDRA system organ class and frequency

System organ class	Adverse reaction(s)	Frequency
Infections and infestations	Pneumonia* Upper respiratory tract infection Bronchitis, Influenza Candidiasis of mouth and throat	Common
Nervous system disorders	Headache	Very common
Cardiac disorders	Extrasystoles	Uncommon
Respiratory, thoracic & mediastinal disorders	Nasopharyngitis Oropharyngeal pain, Sinusitis, Pharyngitis, Rhinitis, Cough, Dysphonia	Very common Common
Gastrointestinal disorders	Abdominal pain	Common
Musculoskeletal and connective tissue disorders	Arthralgia, Back pain Fractures**	Common
General disorders and administration site conditions	Pyrexia	Common

Description of selected adverse reactions

*Pneumonia (see Section 4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE)

In two replicate 12-month studies in a total of 3,255 patients with COPD (mean post-bronchodilator screening FEV₁ 45% of predicted, standard deviation (SD) 13%) who had experienced a COPD exacerbation in the previous year, there was a higher incidence of pneumonia (6%-7%) reported in patients receiving the fluticasone furoate (at strengths of 50, 100, and 200 micrograms)/vilanterol 25 micrograms combination than in those receiving vilanterol 25 micrograms alone (3%). Pneumonia which required hospitalisation occurred in 3% of patients receiving fluticasone furoate/vilanterol (all strengths) and in <1% of patients receiving vilanterol. In these studies, nine fatal cases of pneumonia were reported. Of these, seven were reported during treatment with fluticasone furoate/vilanterol 200/25 micrograms, one during treatment with fluticasone furoate/vilanterol 100/25 micrograms, and one post-treatment with vilanterol monotherapy. Risk factors for pneumonia observed in these studies included current smokers, patients with a history of prior pneumonia, patients with a body mass index <25 kg/m² and patients with an FEV₁<50% predicted (see Section 4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE).

In SUMMIT, a multi-centre, randomised study (HZC113782), 16,568 subjects (safety population) received fluticasone furoate/vilanterol 100/25 micrograms, fluticasone furoate 100 micrograms, vilanterol 25 micrograms or placebo for a mean of 1.7 years. Subjects had moderate COPD (mean post-bronchodilator screening FEV₁ 60% of predicted, SD 6%) and a history of, or an increased risk of, cardiovascular disease. The annualised event rate (per 1000 treatment-years) of serious pneumonia was 22.4 for fluticasone furoate/vilanterol 100/25, 25.1 for fluticasone furoate 100 micrograms, 16.4 for vilanterol 25 micrograms, and 22.2 for placebo. The annualised event rate (per 1000 treatment-years) for adjudicated, on-treatment deaths due to pneumonia was 1.8 for fluticasone furoate/vilanterol 100/25, 1.5 for fluticasone furoate 100 micrograms, 0.9 for vilanterol 25 micrograms, and 1.4 for placebo.

In an integrated analysis of 11 studies in asthma (7,034 patients), the incidence of pneumonia (adjusted for exposure, due to low numbers and limited number of patients on placebo) seen with fluticasone furoate/vilanterol 100/25 microgram strength (9.6/1000 patient years) was similar to placebo (8.0/1000 patient years). There was a higher incidence of pneumonia in the 200/25 microgram strength (18.4/1000 patient years) compared to the 100/25 microgram strength. Few of the pneumonia events led to hospitalisation with either strength, and there were no observed differences in the incidence of serious events between the two treatment strengths.

Cardiovascular events (see Section 4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE)

For the SUMMIT study (see description above), the annualised event rate (per 1000 treatment-years) of serious cardiovascular events was 64.5 for fluticasone furoate/vilanterol 100/25, 58.1 for fluticasone furoate 100 micrograms, 59.2 for vilanterol 25 micrograms, and 63.2 for placebo. The annualised event rate (per 1000 treatment-years) for adjudicated cardiovascular deaths was 11.7 for fluticasone furoate/vilanterol 100/25, 11.6 for fluticasone furoate 100 micrograms, 12.9 for vilanterol 25 micrograms, and 13.0 for placebo.

**Fractures

In two replicate 12-month studies in a total of 3,255 patients with COPD the incidence of bone fractures overall was low in all treatment groups, with a higher incidence in all fluticasone furoate/vilanterol groups (2%) compared with the vilanterol 25 micrograms group (<1%). Although there were more fractures in the fluticasone furoate/vilanterol groups compared with the vilanterol 25 micrograms group, fractures typically associated with corticosteroid use (e.g., spinal compression/thoracolumbar vertebral fractures, hip and acetabular fractures) occurred in <1% of the fluticasone furoate/vilanterol and vilanterol treatment arms.

In an integrated analysis of 11 studies in asthma (7,034 patients), the incidence of fractures was <1%, and usually associated with trauma.

Post-marketing data

There are limited post-marketing data available. Because of the limited long-term safety data (beyond one year) for BREO ELLIPTA, assumptions about long-term safety for this combination product have been based on data from pharmaceuticals in the same class.

Table 5. Post-marketing data System organ class	Adverse reaction(s)	Frequency
Immune system disorders	Hypersensitivity reactions including anaphylaxis, angioedema, rash, and urticaria.	Rare
Metabolism and nutrition disorders	Hyperglycaemia	Uncommon
Psychiatric disorders	Anxiety	Rare
Nervous system disorders	Tremor	Rare
Cardiac disorders	Palpitations Tachycardia	Rare Rare
Respiratory, thoracic and mediastinal disorders	Paradoxical bronchospasm	Rare
Musculoskeletal and connective tissue disorders	Muscle spasms	Common

Reporting suspected adverse effects

Reporting suspected adverse reactions after registration of the medicinal product is important. It allows continued monitoring of the benefit-risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions at www.tga.gov.au/reporting-problems.

4.9 OVERDOSE

Symptoms and signs

There are no data available from clinical trials on overdose with BREO ELLIPTA.

An overdose of BREO ELLIPTA may produce signs and symptoms due to the individual components' actions, including those seen with overdose of other beta₂-agonists and consistent with the known inhaled corticosteroid class effects (see Section 4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE).

Treatment

There is no specific treatment for an overdose with BREO ELLIPTA. If overdose occurs, the patient should be treated supportively with appropriate monitoring as necessary.

Cardioselective beta-blockade should only be considered for profound vilanterol overdose effects that are clinically concerning and unresponsive to supportive measures. Cardioselective beta-blocking drugs should be used with caution in patients with a history of bronchospasm.

Further management should be as clinically indicated. For information on the management of overdose, contact the Poison Information Centre on 13 11 26 (Australia).

5 PHARMACOLOGICAL PROPERTIES

5.1 PHARMACODYNAMIC PROPERTIES

Mechanism of action

Fluticasone furoate and vilanterol represent two classes of medications (a synthetic corticosteroid and a selective, long-acting beta₂-receptor agonist).

Fluticasone furoate

Fluticasone furoate is a synthetic trifluorinated corticosteroid with potent anti-inflammatory activity. The precise mechanism through which fluticasone furoate affects asthma and COPD symptoms is not known. Corticosteroids have been shown to have a wide range of actions on multiple cell types (e.g. eosinophils, macrophages, lymphocytes) and mediators (e.g. cytokines and chemokines involved in inflammation).

Vilanterol trifenate

Vilanterol trifenate is a selective long-acting, beta₂-adrenergic agonist (LABA).

The pharmacologic effects of beta₂-adrenoceptor agonist drugs, including vilanterol trifenate, are at least in part attributable to stimulation of intracellular adenylate cyclase, the enzyme that catalyzes the conversion of adenosine triphosphate (ATP) to cyclic-3',5'-

adenosine monophosphate (cyclic AMP). Increased cyclic AMP levels cause relaxation of bronchial smooth muscle and inhibition of release of mediators of immediate hypersensitivity from cells, especially from mast cells.

Molecular interactions occur between corticosteroids and LABAs, whereby steroids activate the beta₂-receptor gene, increasing receptor number and sensitivity; and LABAs prime the glucocorticoid receptor for steroid-dependent activation and enhance cell nuclear translocation. These synergistic interactions are reflected in enhanced anti-inflammatory activity, which has been demonstrated *in vitro* and *in vivo* in a range of inflammatory cells relevant to the pathophysiology of both asthma and COPD. In peripheral blood mononuclear cells from subjects with COPD, a larger anti-inflammatory effect was seen in the presence of the combination of fluticasone furoate/vilanterol compared with fluticasone furoate alone at concentrations achieved with clinical doses.

Clinical trials

Asthma

The safety and efficacy of fluticasone furoate (FF) and vilanterol (VI) in the treatment of asthma has been evaluated in 3 randomised, double-blind clinical trials of between 12 to 76 weeks in duration (HZA106827, HZA106829 and HZA106837) involving 3,210 patients 12 years of age and older with persistent asthma.

All subjects were using an ICS (Inhaled Corticosteroid) with or without LABA for at least 12 weeks prior to Visit 1. In HZA106837 all patients had at least one exacerbation that required treatment with oral corticosteroids in the year prior to Visit 1. HZA106827 was 12 weeks in duration and evaluated the efficacy of fluticasone furoate/vilanterol 100 micrograms/25 micrograms [n=201] and FF (fluticasone furoate) 100 micrograms [n=205] compared with placebo [n=203], all administered once daily. HZA106829 was 24 weeks in duration and evaluated the efficacy of fluticasone furoate/vilanterol 200 micrograms/25 micrograms [n=197] and FF 200 micrograms [n=194] both administered once daily compared with fluticasone propionate (FP) 500 micrograms twice daily [n=195].

In HZA106827/HZA106829 the co-primary efficacy endpoints were change from baseline in clinic visit trough (pre-bronchodilator and pre-dose) FEV₁ at the end of the treatment period in all subjects and weighted mean serial FEV₁ over 0-24 hours post-dose calculated in a subset of subjects at the end of the treatment period. Change from baseline in the percentage of rescue-free 24 hour periods during treatment was a powered secondary endpoint. Results for the primary and key secondary endpoints in these studies are described in table below:

Table 6. Summary of Data from Studies HZA106829 and HZA106827

Study No.	HZA106829		HZA106827	
Treatment Dose of FF/VI*(micrograms)	FF/VI 200/25 Once Daily vs FF 200 Once Daily	FF/VI 200/25 Once Daily vs FP 500 Twice Daily	FF/VI 100/25 Once Daily vs FF 100 Once Daily	FF/VI/100/25 Once Daily vs placebo Once Daily
Change from Baseline in Trough FEV ₁ Last Observation Carried Forward (LOCF)				
Treatment difference	193 mL	210 mL	36 mL	172 mL
P value (95% CI)	p<0.001 (108, 277)	p<0.001 (127, 294)	p=0.405 (-48, 120)	p<0.001 (87, 258)
Weighted Mean Serial FEV ₁ over 0-24 hours post-dose				
Treatment difference	136 mL	206 mL	116 mL	302 mL

P value (95% CI)	p=0.048 (1, 270)	p=0.003 (73, 339)	p=0.06 (-5, 236)	p<0.001 (178, 426)
Change from Baseline in Percentage of Rescue-Free 24-hour Periods				
Treatment difference P value (95% CI)	11.7% p<0.001 (4.9, 18.4)	6.3% p=0.067 (-0.4, 13.1)	10.6% p<0.001 (4.3, 16.8)	19.3% p<0.001 (13.0, 25.6)
Change from Baseline in Percentage of Symptom-Free 24-hour Periods				
Treatment difference P value (95% CI)	8.4% p=0.010 (2.0, 14.8)	4.9% p=0.137 (-1.6, 11.3)	12.1% p<0.001 (6.2, 18.1)	18.0% p<0.001 (12.0, 23.9)
Change from Baseline in AM Peak Expiratory Flow				
Treatment difference P value (95% CI)	33.5 L/min p<0.001 (25.3, 41.7)	32.9 L/min p<0.001 (24.8, 41.1)	14.6 L/min p<0.001 (7.9, 21.3)	33.3 L/min p<0.001 (26.5, 40.0)
Change from Baseline in PM Peak Expiratory Flow				
Treatment difference P value (95% CI)	30.7 L/min p<0.001 (22.5, 38.9)	26.2 L/min p<0.001 (18.0, 34.3)	12.3 L/min p<0.001 (5.8, 18.8)	28.2 L/min p<0.001 (21.7, 34.8)

*FF/VI = fluticasone furoate/vilanterol

In Study HZA106829, FF 200 once daily was non-inferior to FP 500 twice daily for the primary endpoint of trough FEV₁ using a predefined non-inferiority margin of -125 mL (treatment difference of 18 mL [95% CI: -66, 102]).

HZA106837 was of variable treatment duration (from a minimum of 24 weeks to a maximum of 76 weeks with the majority of patients treated for at least 52 weeks). In HZA106837 patients were randomised to receive either fluticasone furoate/vilanterol 100 micrograms/25 micrograms [n=1009] or FF 100 micrograms [n=1010] both administered once daily. In HZA106837 the primary endpoint was the time to first severe asthma exacerbation. A severe asthma exacerbation was defined as deterioration of asthma requiring the use of systemic corticosteroids for at least 3 days or an inpatient hospitalization or emergency department visit due to asthma that required systemic corticosteroids. Adjusted mean change from baseline in trough FEV₁ was also evaluated as a secondary endpoint.

In HZA106837 the risk of experiencing a severe asthma exacerbation in patients receiving fluticasone furoate/vilanterol 100 micrograms/25 micrograms was reduced by 20% compared with FF 100 micrograms alone (hazard ratio 0.795, p=0.036 95% CI (0.642, 0.985)). The rate of severe asthma exacerbations per patient per year was 0.19 in the FF 100 group (approximately 1 in every 5 years) and 0.14 in the fluticasone furoate/vilanterol 100 micrograms/25 micrograms group (approximately 1 in every 7 years). The ratio of the exacerbation rate for fluticasone furoate/vilanterol 100 micrograms/25 micrograms versus FF 100 was 0.755 (95% CI 0.603, 0.945). This represents a 25% reduction in the rate of severe asthma exacerbations for subjects treated with fluticasone furoate/vilanterol 100 micrograms/25 micrograms compared with FF 100 (p=0.014). The 24-hour bronchodilator effect of fluticasone furoate/vilanterol was maintained throughout a one-year treatment period with no evidence of loss in efficacy (no tachyphylaxis). Fluticasone furoate/vilanterol 100 micrograms/25 micrograms consistently demonstrated 83 mL to 95 mL improvements in trough FEV₁ at weeks 12, 36 and 52 and Endpoint compared with FF 100 micrograms (p<0.001 95% CI 52, 126 mL at Endpoint). Forty four percent of patients in

the fluticasone furoate/vilanterol 100 micrograms/25 group were well controlled (ACQ7 ≤ 0.75) at end of treatment compared to 36% of subjects in the FF 100 microgram group ($p < 0.001$ 95% CI 1.23, 1.82).

Studies versus salmeterol/fluticasone propionate combinations

In a 24-week study (HZA113091) in adult and adolescent patients with persistent asthma both fluticasone furoate/vilanterol 100 micrograms/25 micrograms given once daily in the evening and FP/salmeterol 250/50 micrograms given twice daily demonstrated improvements from baseline in lung function. Adjusted mean treatment increases from baseline in weighted mean 0-24 hours FEV₁ of 341 mL (fluticasone furoate/vilanterol) and 377 mL (FP/salmeterol) demonstrated an overall improvement in lung function over 24 hours for both treatments. The adjusted mean treatment difference of 37 mL between the groups was not statistically significant ($p = 0.162$).

Fluticasone furoate monotherapy

A 24-week randomised, double-blind placebo controlled study (FFA112059) evaluated the safety and efficacy of FF 100 micrograms once daily [$n = 114$] and FP 250 micrograms twice daily [$n = 114$] versus placebo [$n = 115$] in adult and adolescent patients with persistent asthma. All subjects had to have been on a stable dose of an ICS for at least 4 weeks prior to visit 1 (screening visit) and the use of LABAs was not permitted within 4 weeks of visit 1. The primary efficacy endpoint was change from baseline in clinic visit trough (pre-bronchodilator and pre-dose) FEV₁ at the end of the treatment period. Change from baseline in the percentage of rescue-free 24-hour periods during the 24-week treatment period was a powered secondary. At the 24-week time point FF 100 and FP increased trough FEV₁ by 146 mL (95% CI 36, 257 mL, $p = 0.009$) and 145 mL (95% CI 33, 257 mL, $p = 0.011$) respectively compared to placebo. FF and FP both increased the percentage of 24-hour rescue free periods by 14.8% (95% CI 6.9, 22.7, $p < 0.001$) and 17.9% (95% CI 10.0, 25.7, $p < 0.001$) respectively versus placebo.

Allergen Challenge study

The bronchoprotective effect of fluticasone furoate/vilanterol 100 micrograms/25 micrograms on the early and late asthmatic response to inhaled allergen was evaluated in a repeat dose, placebo-controlled four-way crossover study (HZA113126) in patients with mild asthma. Patients were randomized to receive fluticasone furoate/vilanterol 100/25 micrograms, FF 100 micrograms, VI (vilanterol) 25 micrograms or placebo once daily for 21 days followed by challenge with allergen 1 hour after the final dose. The allergen was house dust mite, cat dander, or birch pollen; the selection was based on individual screening tests. Serial FEV₁ measurements were compared with pre-allergen challenge values taken after saline inhalation (baseline). Overall, the greatest effects on the early asthmatic response were seen with fluticasone furoate/vilanterol 100 micrograms/25 micrograms compared with FF 100 micrograms or vilanterol 25 micrograms alone. Both fluticasone furoate/vilanterol (100 micrograms/25 micrograms) and FF 100 micrograms virtually abolished the late asthmatic response compared with vilanterol alone. Fluticasone furoate/vilanterol 100/25 micrograms provided significantly greater protection against allergen-induced bronchial hyper-reactivity compared with monotherapies FF and VI as assessed on Day 22 by methacholine challenge.

Chronic Obstructive Pulmonary Disease

The COPD clinical development programme included a 12-week (HZC113107), two 6-month (HZC112206, HZC112207), two one-year randomised controlled studies (HZC102970, HZC102871) and one long-term study (SUMMIT) in patients with a clinical diagnosis of COPD. These studies included measures of lung function, dyspnoea and moderate and severe exacerbations.

Six-month studies

HZC112206 and HZC112207 were 24-week randomised, double-blind, placebo controlled, parallel group studies comparing the effect of the combination to vilanterol and FF alone and placebo. HZC112206 evaluated the efficacy of fluticasone furoate/vilanterol 50 micrograms/25 micrograms [n=206] and fluticasone furoate/vilanterol 100 micrograms/25 micrograms [n=206] compared with FF 100 micrograms [n=206], vilanterol 25 micrograms [n=205] and placebo (n = 207), all administered once daily. HZC112207 evaluated the efficacy of fluticasone furoate/vilanterol 100 micrograms/25 micrograms [n=204] and fluticasone furoate/vilanterol 200 micrograms/25 micrograms [n=205] compared with FF 100 micrograms [n=204], 200 micrograms [n=203] and vilanterol 25 micrograms [n=203] and placebo [n=205], all administered once daily.

All patients were required to have a smoking history of at least 10 pack years; a post-salbutamol FEV₁/FVC ratio less than or equal to 0.70; post-salbutamol FEV₁ less than or equal to 70% predicted and have a Modified Medical Research Council (mMRC) dyspnea score ≥ 2 (scale 0-4) at screening. At screening, the mean pre-bronchodilator FEV₁ was 42.6% and 43.6% predicted, and the mean reversibility was 15.9% and 12.0% in HZC112206 and HZC112207, respectively. The co-primary endpoints in both studies were weighted mean FEV₁ from zero to 4 hours post-dose at Day 168 and change from baseline in pre-dose trough FEV₁ at Day 169.

In an integrated analysis of both studies, fluticasone furoate/vilanterol 100 micrograms/25 micrograms showed clinically meaningful improvements in lung function. At Day 169 fluticasone furoate/vilanterol 100 micrograms/25 micrograms and vilanterol increased adjusted mean trough FEV₁ by 129 mL (95% CI: 91, 167 mL, p<0.001) and 83 mL (95% CI: 46, 121 mL, p<0.001) respectively compared to placebo. Fluticasone furoate/vilanterol 100 micrograms/25 micrograms increased trough FEV₁ by 46 mL compared to vilanterol (95% CI: 8, 83 mL, p= 0.017). At Day 168 fluticasone furoate/vilanterol 100 micrograms/25 micrograms and vilanterol increased adjusted mean weighted mean FEV₁ over 0-4 hours by 193 mL (95% CI: 156, 230 mL, p<0.001) and 145 mL (95% CI: 108, 181 mL, p<0.001) respectively compared to placebo. Fluticasone furoate/vilanterol 100/25 micrograms increased adjusted mean weighted mean FEV₁ over 0-4 hours by 148 mL compared to FF alone (95% CI: 112, 184 mL, p< 0.001).

In both the HZC112206 and HZC112207 studies, at Day 168, differences were seen in the adjusted mean change from baseline CRQ-SAS dyspnoea scores between the fluticasone furoate/vilanterol 100 micrograms/25 micrograms and placebo groups (HZC112206: 0.30, (95% CI 0.06,0.54 p=0.014); HZC112207: 0.24, (95% CI 0.02,0.46 p=0.029) and between the fluticasone furoate/vilanterol 100 micrograms/25 micrograms and FF 100 microgram

groups (HZC112206: 0.24, (95% CI 0.01,0.48, p=0.044); HZC112207: 0.36, (95% CI (0.14,0.57), p=0.001). For all the other pair-wise treatment comparisons at Day 168 for the CRQ-SAS dyspnoea score, the p-value was >0.05. In both studies, none of the treatment comparisons at Day 168 achieved a minimal clinically important difference (>0.5 point improvement) in mean CRQ-SAS Dyspnoea Domain scores. Patients treated with fluticasone furoate/vilanterol 100 micrograms/25 micrograms also had significantly less cough and sputum, required significantly less rescue medication as measured by number of occasions of rescue salbutamol use (per 24-hour period) and number of night time awakenings requiring salbutamol (per 24-hour period) compared to placebo.

12-month studies

Studies HZC102970 and HZC102871 were 52-week randomised, double-blind, parallel-group, studies comparing the effect of fluticasone furoate/vilanterol 200 micrograms/25 micrograms, fluticasone furoate/vilanterol 100 micrograms/25 micrograms, fluticasone furoate/vilanterol 50 micrograms/25 micrograms with vilanterol 25 micrograms, all administered once daily, on the annual rate of moderate/severe exacerbations in subjects with COPD with a smoking history of at least 10 pack years and a post-salbutamol FEV₁/FVC ratio less than or equal to 0.70 and post-salbutamol FEV₁ less than or equal to 70% predicted and documented history of ≥1 COPD exacerbation that required antibiotics and/or oral corticosteroids or hospitalisation in the 12 months prior to visit 1. The primary endpoint was the annual rate of moderate and severe exacerbations. Moderate/severe exacerbations were defined as worsening symptoms that required treatment with oral corticosteroids and/or antibiotics or in-patient hospitalisation. Both studies had a 4-week run-in period during which all subjects received open-label FP/salmeterol 250/50 twice daily to standardise COPD pharmacotherapy and stabilise disease prior to randomisation to blinded study medication for 52 weeks. Prior to run-in, subjects discontinued use of previous COPD medications except short-acting bronchodilators. The use of concurrent inhaled long-acting bronchodilators (beta₂-agonist and anticholinergic), ipratropium/salbutamol combination products, oral beta₂-agonists, and theophylline preparations were not allowed during the treatment period. Oral corticosteroids and antibiotics were allowed for the acute treatment of COPD exacerbations with specific guidelines for use. Subjects used salbutamol on an as-needed basis throughout the studies.

The results of an integrated analysis showed that treatment with fluticasone furoate/vilanterol 100/25 micrograms once daily resulted in a 27% reduction in the annual rate of moderate or severe COPD exacerbations compared with vilanterol (95% CI: 0.63, 0.84 (p<0.001). Similar reductions in the time to first exacerbation and exacerbations requiring systemic corticosteroid use were observed with fluticasone furoate/vilanterol 100/25 micrograms once daily.

Table 7. Analysis of Exacerbation Rates following 12 months of treatment

Endpoint	HZC102970		HZC102871		HZC102970 and HZC102871 integrated	
	Vilanterol (n=409)	FF/VI 100/25 (n=403)	Vilanterol (n=409)	FF/VI 100/25 (n=403)	Vilanterol (n=818)	FF/VI 100/25 (n=806)
Moderate and severe exacerbations						
Adjusted mean annual rate	1.14	0.90	1.05	0.70	1.11	0.81

Ratio vs VI		0.79		0.66		0.73
95% CI		(0.64,0.97)		(0.54, 0.81)		(0.63, 0.84)
p-value		0.024		<0.001		<0.001
% reduction		21		34		27
95% CI		(3, 36)		(19,46)		(16, 37)
Time to first exacerbation:						
Hazard ratio		0.80		0.72		0.76
(95% CI)		(0.66, 0.99)		(0.59, 0.89)		(0.66, 0.88)
% risk reduction		20		28		24
p-value		0.036		0.002		p<0.001
Exacerbations requiring systemic/oral corticosteroids						
Annual rate	0.86	0.66	0.84	0.52	0.87	0.61
Ratio vs VI		0.77		0.62		0.70
95% CI		(0.60,0.99)		(0.49, 0.78)		(0.59, 0.83)
p-value		0.041		<0.001		<0.001
% reduction		23		38		30
95% CI		(1, 40)		(22, 51)		(17, 41)

In an integrated analysis of HZC102970 and HZC102871 at week 52, an improvement was seen when comparing the fluticasone furoate/vilanterol 100 micrograms/25 micrograms vs. vilanterol 25 micrograms in adjusted mean trough FEV₁ (42 mL 95% CI: 19, 64 mL, p<0.001). The 24-hour bronchodilator effect of fluticasone furoate/vilanterol was maintained from the first dose throughout a one-year treatment period with no evidence of loss in efficacy (no tachyphylaxis).

Overall, across the two studies combined 2,009 (62%) patients had cardiovascular history/risk factors at screening. The incidence of cardiovascular history/risk factors was similar across the treatment groups with patients in the cardiovascular history/risk factors subgroup most commonly suffering from hypertension (46%), followed by hypercholesterolemia (29%) and diabetes mellitus (12 %). Similar effects in reduction of moderate and severe exacerbations were observed in this subgroup as compared with the overall population. In patients with a cardiovascular history/risk factors, fluticasone furoate/vilanterol 100 micrograms/25 micrograms resulted in a significantly lower annual rate of moderate/severe COPD exacerbations compared with vilanterol (adjusted mean annual rates of 0.83 and 1.18 respectively, 30% reduction (95% CI 16, 42%, p<0.001). Improvements were also seen in this subgroup at week 52 when comparing the fluticasone furoate/vilanterol 100 micrograms/25 micrograms vs. vilanterol 25 micrograms in adjusted mean trough FEV₁ (44 mL 95% CI: 15, 73 mL, (p=0.003).

Long-term study

SUMMIT was a multi-centre, randomised, double-blind study evaluating the effect on survival of fluticasone furoate/vilanterol 100/25 micrograms compared with placebo. 16,590 patients were randomised and of these, 16,485 subjects were included in the intent-to-treat efficacy population. Subjects were treated for up to 4 years (mean 1.7 years) with either fluticasone furoate/vilanterol 100/25 micrograms, fluticasone furoate 100 micrograms, vilanterol 25 micrograms, or placebo. All subjects had COPD with moderate airflow limitation ($\geq 50\%$ and $\leq 70\%$ predicted FEV₁) and a history of, or an increased risk of, cardiovascular (CV) disease. The primary endpoint was all-cause mortality, while secondary endpoints were

a composite of cardiovascular events (on-treatment cardiovascular death, myocardial infarction, stroke, unstable angina, or transient ischemic attack) and the rate of decline in post-bronchodilator FEV₁. In the year prior to study start, 39% of subjects experienced at least one COPD exacerbation and 15% experienced 2 or more COPD exacerbations. Prior to the start of the study, 35% of subjects were taking long-acting beta₂ agonists and 15% were taking long-acting anti-cholinergic medications – these medications were stopped prior to study entry per protocol. The patient baseline characteristics described above are provided in the table below per treatment arm:

Table 8. Summary of Baseline Characteristics from Study HZC113782 (SUMMIT)

Baseline characteristic	FF/VI 100/25	FF 100	VI 25	Placebo
	N=4121	N=4135	N=4118	N=4111
COPD exacerbation history, n (%)				
0	2528 (61)	2546 (62)	2500 (61)	2447 (60)
1	998 (24)	990 (24)	988 (24)	1044 (25)
≥2	595 (14)	599 (14)	630 (15)	620 (15)
Baseline medications, n (%)				
Long-acting beta ₂ -agonist	1456 (35)	1432 (35)	1464 (36)	1417 (34)
Long-acting anticholinergic	638 (15)	619 (15)	634 (15)	659 (16)
Inhaled Corticosteroids	1394 (34)	1369 (33)	1374 (33)	1349 (33)

All-cause mortality was not statistically significantly different between placebo and fluticasone furoate/vilanterol (HR 0.878; 95% CI: 0.739, 1.042). All-cause mortality (per 100 patient-years) was 3.1 for fluticasone furoate/vilanterol, 3.5 for placebo, 3.2 for fluticasone furoate, and 3.4 for vilanterol.

The mean rate of decline in FEV₁ was fluticasone furoate/vilanterol, 38 mL/year; placebo, 46 mL/year; fluticasone furoate, 38 mL/year; and vilanterol, 47 mL/year.

The incidence of cardiovascular composite events (per 100 patient-years of treatment exposure) was 2.5 for fluticasone furoate/vilanterol, 2.7 for placebo, 2.4 for fluticasone furoate, and 2.6 for vilanterol.

The annual rate of severe exacerbations per patient per year (requiring hospitalisation) was 0.05 for fluticasone furoate/vilanterol, 0.07 for placebo, 0.06 for fluticasone furoate, and 0.06 for vilanterol.

Table 9. Summary of Efficacy Data from Study HZC113782 (SUMMIT)

Efficacy endpoint	FF/VI 100/25	FF 100	VI 25	Placebo
	N=4121	N=4135	N=4118	N=4111
All-cause mortality (per 100 patient-years)	3.1	3.2	3.4	3.5
FEV ₁ decline (mL/year)	38	38	47	46
Cardiovascular composite endpoint (per 100 patient-years of treatment exposure)	2.5	2.4	2.6	2.7
Annual rate of severe exacerbations per patient per year (requiring hospitalisation)	0.05	0.06	0.06	0.07

Studies versus salmeterol/fluticasone propionate combinations

In a 12-week study (HZC113107) in COPD patients both fluticasone furoate/vilanterol 100 micrograms/25 micrograms given once daily in the morning and FP/salmeterol 500/50 micrograms given twice daily, demonstrated improvements from baseline in lung function. Adjusted mean treatment increases from baseline in weighted mean 0-24 hours FEV₁ of 130 mL (fluticasone furoate/vilanterol) and 108 mL (FP/salmeterol) demonstrated an overall improvement in lung function over 24 hours for both treatments. The adjusted mean treatment difference of 22 mL (95% CI: -18, 63 mL) between the groups was not statistically significant (p=0.282). A clinically meaningful mean improvement was achieved for mean change from baseline in SGRQ Total Score after 12 weeks of treatment for the fluticasone furoate/vilanterol 100 micrograms/25 micrograms once daily treatment group (-4.78) but not for the FP/salmeterol 500/50 twice daily treatment group (-3.29). The adjusted mean treatment difference was -1.50 (p=0.215. 95% CI (-3.86, 0.87)).

5.2 PHARMACOKINETIC PROPERTIES

Absorption

The absolute bioavailability for fluticasone furoate and vilanterol when administered by inhalation as fluticasone furoate/vilanterol was on average 15.2% and 27.3%, respectively. The oral bioavailability of both fluticasone furoate and vilanterol was low, on average 1.26% and <2%, respectively. Given this low oral bioavailability, systemic exposure for fluticasone furoate and vilanterol following inhaled administration is primarily due to absorption of the inhaled portion of the dose delivered to the lung.

Distribution

Following intravenous dosing, both fluticasone furoate and vilanterol are extensively distributed with average volumes of distribution at steady state of 661 L and 165 L, respectively.

Both fluticasone furoate and vilanterol have a low association with red blood cells. In vitro plasma protein binding in human plasma of fluticasone furoate and vilanterol was high, on average >99.6% and 93.9%, respectively. There was no decrease in the extent of in vitro plasma protein binding in subjects with renal or hepatic impairment.

Fluticasone furoate and vilanterol are substrates for P-glycoprotein (P-gp), however, concomitant administration of fluticasone furoate/vilanterol with P-gp inhibitors is considered unlikely to alter fluticasone furoate or vilanterol systemic exposure since they are both well absorbed molecules.

Metabolism

Based on *in vitro* data, the major routes of metabolism of both fluticasone furoate and vilanterol in human are mediated primarily by CYP3A4.

Fluticasone furoate is primarily metabolised through hydrolysis of the S-fluoromethyl carbothioate group to metabolites with significantly reduced corticosteroid activity.

Vilanterol is primarily metabolised by O-dealkylation to a range of metabolites with significantly reduced β_1 - and β_2 -agonist activity.

A repeat dose CYP3A4 drug interaction study was performed in healthy subjects with the fluticasone furoate/vilanterol combination (200/25) and the strong CYP3A4 inhibitor ketoconazole (400 mg). Co-administration increased mean fluticasone furoate $AUC_{(0-24)}$ and C_{max} by 36% and 33%, respectively. The increase in fluticasone furoate exposure was associated with a 27% reduction in 0-24 h weighted mean serum cortisol. Co-administration increased mean vilanterol $AUC_{(0-t)}$ and C_{max} 65% and 22%, respectively. The increase in vilanterol exposure was not associated with an increase in beta-agonist related systemic effects on heart rate, blood potassium or QTcF interval.

Excretion

Following oral administration, fluticasone furoate was eliminated in humans mainly by metabolism with metabolites being excreted almost exclusively in faeces, with <1% of the recovered radioactive dose eliminated in the urine. The apparent plasma elimination half-life of fluticasone furoate following inhaled administration of fluticasone furoate/vilanterol was, on average, 24 hours.

Following oral administration, vilanterol was eliminated in humans mainly by metabolism followed by excretion of metabolites in urine and faeces of approximately 70% and 30% of the radioactive dose, respectively. The apparent plasma elimination half-life of vilanterol following inhaled administration of fluticasone furoate/vilanterol was, on average, 2.5 hours.

Special Patient Populations

Population PK meta-analyses for fluticasone furoate and vilanterol were conducted in phase III studies in subjects with asthma or COPD. The impact of demographic covariates (age, gender, weight, BMI, racial group, ethnicity) on the pharmacokinetics of fluticasone furoate and vilanterol were evaluated as part of the population pharmacokinetic analysis.

Race

In elderly subjects with asthma or COPD estimates of fluticasone furoate $AUC_{(0-24)}$ for East Asian, Japanese and South Asian subjects (12-14% subjects) were up to 53% higher on average compared with Caucasian subjects. However, there was no evidence for the higher systemic exposure in these populations to be associated with greater effect on 24 hour urinary cortisol excretion. There was no effect of race on pharmacokinetic parameter estimates of vilanterol in subjects with COPD.

In subjects with asthma, on average, vilanterol C_{max} is estimated to be 220 to 287% higher and $AUC_{(0-24)}$ comparable for those subjects from an Asian heritage compared with subjects from other racial groups. However, there was no evidence that this higher vilanterol C_{max} resulted in clinically significant effects on heart rate.

Children

BREO ELLIPTA should not be used in children (i.e. patients younger than 12 years of age).

In adolescents (12 years or older), there are no recommended dose modifications.

Elderly

The effects of age on the pharmacokinetics of fluticasone furoate and vilanterol were determined in phase III studies in COPD and asthma.

There was no evidence for age (12-84) to affect the PK of fluticasone furoate or vilanterol in subjects with asthma.

There was no evidence for age to affect the PK of fluticasone furoate in subjects with COPD while there was an increase (37%) in AUC₍₀₋₂₄₎ of vilanterol over the observed age range of 41 to 84 years. For an elderly subject (aged 84 years) with low bodyweight (35 kg) vilanterol AUC₍₀₋₂₄₎ is predicted to be 35% higher than the population estimate (subject with COPD aged 60 years and bodyweight of 70 kg), whilst C_{max} was unchanged. These differences are unlikely to be of clinical relevance.

Renal Impairment

A clinical pharmacology study of fluticasone furoate/vilanterol showed that severe renal impairment (creatinine clearance <30 mL/min) did not result in significantly greater exposure to fluticasone furoate or vilanterol or more marked corticosteroid or beta₂-agonist systemic effects compared with healthy subjects. No dose adjustment is required for patients with renal impairment.

The effects of haemodialysis have not been studied.

Hepatic Impairment

Following repeat dosing of fluticasone furoate/vilanterol for 7 days, there was an increase in fluticasone furoate systemic exposure (up to three-fold as measured by AUC₍₀₋₂₄₎) in subjects with hepatic impairment (Child-Pugh A, B or C) compared with healthy subjects. The increase in fluticasone furoate systemic exposure (fluticasone furoate/vilanterol 200/25 micrograms) in subjects with moderate hepatic impairment (Child-Pugh B) was associated with an average 34% reduction in serum cortisol compared with healthy subjects. In subjects with severe hepatic impairment (Child-Pugh C) that received a lower dose of 100/12.5 micrograms there was no reduction in serum cortisol. For patients with moderate or severe hepatic impairment the maximum dose is 100/25 micrograms (see Section 4.2 DOSE AND METHOD OF ADMINISTRATION).

Following repeat dosing of fluticasone furoate/vilanterol for 7 days, there was no significant increase in systemic exposure to vilanterol (C_{max} and AUC) in subjects with mild, moderate, or severe hepatic impairment (Child-Pugh A, B or C).

There were no clinically relevant effects of the fluticasone furoate/vilanterol combination on beta-adrenergic systemic effects (heart rate or serum potassium) in subjects with mild or moderate hepatic impairment (vilanterol, 25 micrograms) or with severe hepatic impairment (vilanterol, 12.5 micrograms) compared with healthy subjects.

Gender, Weight and BMI

There was no evidence for gender, weight or BMI to influence the pharmacokinetics of fluticasone furoate based on a population pharmacokinetic analysis of phase III data in 1,213 subjects with asthma (712 females) and 1,225 subjects with COPD (392 females).

There was no evidence for gender, weight or BMI to influence the pharmacokinetics of vilanterol based on a population pharmacokinetic analysis in 856 subjects with asthma (500 females) and 1,091 subjects with COPD (340 females).

No dosage adjustment is necessary based on gender, weight or body mass index (BMI).

5.3 PRECLINICAL SAFETY DATA

Genotoxicity

Fluticasone furoate was not genotoxic in a standard battery of studies.

Vilanterol was negative in a complete battery of *in vitro* (Ames, UDS, SHE cell) assays and *in vivo* (rat bone marrow micronucleus) assays and equivocal in the mouse lymphoma assay. The weight of evidence suggests that vilanterol does not pose a genotoxic risk.

Carcinogenicity

No carcinogenicity studies were performed with the fluticasone furoate/vilanterol triphenylacetate combination.

Fluticasone furoate was not carcinogenic in lifetime inhalation studies in rats or mice at exposures similar to those at the maximum recommended human dose, based on AUC.

Proliferative effects in the female rat and mouse reproductive tract and rat pituitary gland were observed in lifetime inhalation studies with vilanterol, consistent with findings for other beta₂-agonists. There was no increase in tumour incidence in rats or mice at exposures 1- or 30-fold, respectively, those at the maximum recommended human dose, based on AUC.

6 PHARMACEUTICAL PARTICULARS

6.1 LIST OF EXCIPIENTS

lactose monohydrate (which contains milk protein)
magnesium stearate

6.2 INCOMPATIBILITIES

Incompatibilities were either not assessed or not identified as part of the registration of this medicine.

6.3 SHELF LIFE

In Australia, information on the shelf life can be found on the public summary of the Australian Register of Therapeutic Goods (ARTG). The expiry date can be found on the packaging.

Following removal from the tray, the product may be stored for a maximum period of 1 month. Write the date the inhaler should be discarded on the label in the space provided. The date should be added as soon as the inhaler has been removed from the tray.

6.4 SPECIAL PRECAUTIONS FOR STORAGE

Store below 30°C. If stored in the refrigerator, allow the inhaler to return to room temperature for at least an hour before use.

6.5 NATURE AND CONTENTS OF CONTAINER

BREO ELLIPTA is a moulded plastic inhaler with a light grey body, a pale blue mouthpiece cover and a dose counter, packed in a foil tray which contains a desiccant sachet. The tray is sealed with a peelable lid.

The inhaler contains two strips of either 30 or 14 regularly distributed blisters.

Not all pack sizes may be distributed in Australia.

6.6 SPECIAL PRECAUTIONS FOR DISPOSAL

In Australia, any unused medicine or waste material should be disposed of by taking to your local pharmacy.

6.7 PHYSICOCHEMICAL PROPERTIES

Fluticasone furoate is practically insoluble or insoluble in water, and slightly soluble in acetone, dimethylsulphoxide and ethanol.

Vilanterol trifenate is practically insoluble or insoluble in water and slightly soluble in methanol, ethanol, acetonitrile and propan-2-ol.

Chemical structure

Fluticasone furoate	
Chemical name	androsta-1,4-diene-17-carbothioic acid, 6,9-difluoro-17-[(2-furanylcarbonyl)oxy]-11-hydroxy-16-methyl-3-oxo-, S-(fluoromethyl) ester, (6 α ,11 β ,16 α ,17 α)- (9CI)
Molecular formula	C ₂₇ H ₂₉ F ₃ O ₆ S
Structure	
Vilanterol (as trifenate)	
Chemical name	benzeneacetic acid, α,α -diphenyl-, compd. with (α 1R)- α 1-[[[6-[2-[(2,6-dichlorophenyl)methoxy]ethoxy]hexyl]amino]methyl]-4-hydroxy-1,3-benzene dimethanol (1:1)
Molecular formula	C ₂₄ H ₃₃ Cl ₂ NO ₅ .C ₂₀ H ₁₆ O ₂
Structure	

CAS number

Fluticasone furoate: 397864-44-7

Vilanterol trifenate: 503070-58-4

7 MEDICINE SCHEDULE (POISONS STANDARD)

Schedule 4 – Prescription Only Medicine

8 SPONSOR

GlaxoSmithKline Australia Pty Ltd
Level 4,
436 Johnston Street,
Abbotsford, Victoria, 3067

9 DATE OF FIRST APPROVAL

17 April 2014

10 DATE OF REVISION

25 October 2018

SUMMARY TABLE OF CHANGES

Section Changed	Summary of new information
2	Excipient of known effect details clarified
3	New text on pharmaceutical dose form added
4.2	Text reorganised under new headings
4.4	Addition of central serous chorioretinopathy (CSCR) in the 'Systemic corticosteroid effects' section Addition of a new precaution regarding 'Hyperglycaemia' Removal of conflicting pneumonia incidence frequency statement in 'Pneumonia' section,
4.8	Addition of hyperglycaemia in Post-Marketing Experience table, and relocation of Respiratory, thoracic and mediastinal disorders row within table
6.5	Text pertaining to container closure relocated from Section 3
6.7	Text presented in tabular format
All	PI reformatted, minor editorial and formatting changes

HOW TO USE BREO ELLIPTA

What is the Ellipta inhaler?

BREO ELLIPTA is inhaled through the mouth using the Ellipta inhaler.

When you first use the Ellipta inhaler you do not need to check that it is working properly, and you do not need to prepare it for use in any special way. Just follow these step-by-step instructions.

Your Ellipta inhaler carton contains:

The inhaler is packaged in a tray. **Do not open the tray until you are ready to inhale a dose of your medicine.** When you are ready to use your inhaler, peel back the lid to open the tray. The tray contains a **desiccant** sachet, to reduce moisture. Throw this desiccant sachet away – **do not** open, eat or inhale it.

When you take the inhaler out of the sealed tray, it will be in the 'closed' position. **Do not open the inhaler until you are ready to inhale a dose of medicine.** Write the "Discard by"

date on the inhaler label in the space provided. The “Discard by” date is one month from the date you first open the tray. **After this date, the inhaler should no longer be used.**

The step-by-step instructions shown below for the 30-dose (30-day supply) Ellipta inhaler also apply to the 14-dose (14-day supply) Ellipta inhaler.

Important information to read before you start

If you open and close the cover without inhaling the medicine, you will lose the dose.

The lost dose will be securely held inside the inhaler, but it will no longer be available.

It is not possible to accidentally take extra medicine or a double dose in one inhalation.

Dose counter

This shows how many doses of medicine are left in the inhaler.

Before the inhaler has been used, it shows exactly 30 doses.

It counts down by **1** each time you open the cover.

When fewer than 10 doses are left, half of the dose counter shows red.

After you have used the last dose, **half of the dose counter shows red and the number 0 is displayed.** Your inhaler is now empty.

If you open the cover after this, the dose counter will change from half red to completely red.

Cover

Each time you open this, you prepare one dose of medicine.

Step 1: Prepare a dose

Wait to open the cover until you are ready to take your dose.

Do not shake the inhaler.

- **Slide the cover down until you hear a “click”.**

Your medicine is now ready to be inhaled.

The dose counter counts down by 1 to confirm.

- **If the dose counter does not count down as you hear the “click”, the inhaler will not deliver the medicine.**

Take it back to your pharmacist for advice.

- **Do not shake the inhaler at any time.**

Step 2: Inhale your medication

- **Whilst holding the inhaler away from your mouth, breathe out as far as is comfortable.**

Do not breathe out into the inhaler.

- **Put the mouthpiece between your lips, and close your lips firmly around it.**

Do not block the air vent with your fingers.

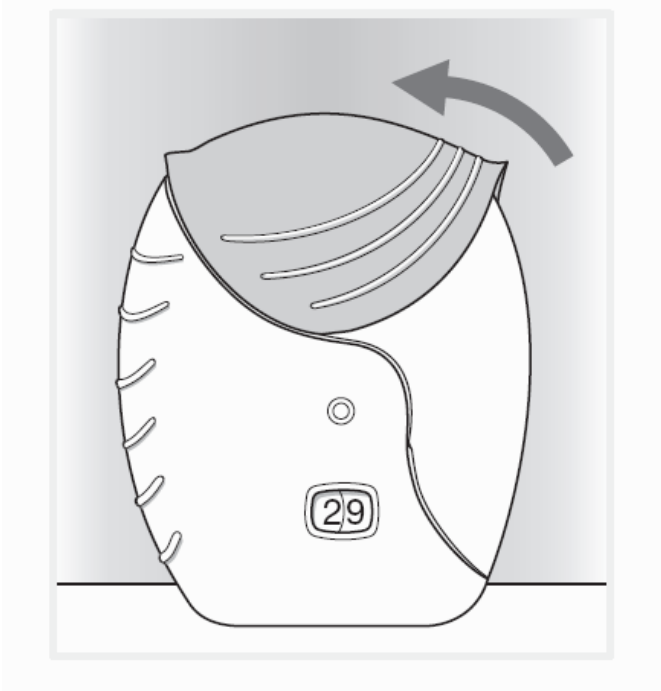

- **Take one long, steady, deep breath in. Hold this breath for about 3-4 seconds or as long as is comfortable.**
- **Remove the inhaler from your mouth.**
- **Breathe out slowly and gently away from the mouthpiece.**

You may not be able to taste or feel the medicine, even when you are using the inhaler correctly.

If you want to clean the mouthpiece, use a **dry tissue, before** you close the cover.

Step 3: Close the inhaler and rinse your mouth

- **Slide the cover upwards as far as it will go, to cover the mouthpiece.**

- **Rinse your mouth with water without swallowing after you have used the inhaler if possible.**

This will make it less likely that you will develop a sore mouth or throat as side effects.
